Secure API Gateway Implementation

Status: Open

Project Description

This project involves implementing a secure API gateway to manage and protect access to backend services. The goal is to provide a unified entry point for APIs while enforcing security, rate limiting, and monitoring policies.

The gateway should support authentication, authorization, and request validation. It must handle high traffic efficiently and provide logging for audit and debugging purposes. Performance and reliability are critical, as the gateway will be a core infrastructure component.

Security best practices must be followed to protect against common threats such as unauthorized access and abuse. The system should be designed for scalability and easy integration with existing services.

Comprehensive documentation should cover configuration, security policies, and operational management. The final solution should enhance system security while simplifying API management.
